ABET Criterion 3: Student Outcomes

The faculty of Computer Science has adopted Criteria (a)-(i) and additional Criteria (j)-(k) as the Student Outcomes for our program.

GENERAL CRITERION 3. STUDENT OUTCOMES

http://www.abet.org/accreditation/accreditation-criteria/criteria-for-accrediting-computing-programs-2015-2016/#outcomes

The program must have documented student outcomes that prepare graduates to attain the program educational objectives. There must be a documented and effective process for the periodic review and revision of these student outcomes. The program must enable students to attain, by the time of graduation:

- (a) An ability to apply knowledge of computing and mathematics appropriate to the programs student outcomes and to the discipline
- (b) An ability to analyze a problem, and identify and define the computing requirements appropriate to its solution
- (c) An ability to design, implement, and evaluate a computer-based system, process, component, or program to meet desired needs
- (d) An ability to function effectively on teams to accomplish a common goal
- (e) An understanding of professional, ethical, legal, security and social issues and responsibilities
- (f) An ability to communicate effectively with a range of audiences
- (g) An ability to analyze the local and global impact of computing on individuals, organizations, and society
- (h) Recognition of the need for and an ability to engage in continuing professional development
- (i) An ability to use current techniques, skills, and tools necessary for computing practice.

These program criteria apply to computing programs using computer science or similar terms in their titles.

The program must enable students to attain, by the time of graduation:

- (j) An ability to apply mathematical foundations, algorithmic principles, and computer science theory in the modeling and design of computer-based systems in a way that demonstrates comprehension of the tradeoffs involved in design choices. [CS]
- (k) An ability to apply design and development principles in the construction of software systems of varying complexity. [CS]

Assessment Guidelines for our Computer Science (University of Kentucky):

- Evaluation of a student learning outcome (SLO) for each of the selected courses requires 3 artifacts, if possible. These could be three separate questions on an exam, three different assignments, or 3 separate components of a single assignment. The preference is on different types of assignments and on assignments that are in a controlled environment: exams, labs, etc. (homework assignments are less desirable). The evaluated assignments/tasks for students should be prepared so there is are sufficient volume and granularity allowing the evaluator for meaningful application of the rubrics.
- Complete one rubric for each selected student; not all students have to be assessed. Pick a random population. Based on a discussion, we decided that we should assess 20% of the students but no less than 10. In practice, when the class is smaller than 50 students, select a sample of min (sizeClass, 10) students, otherwise select one-fifth.
- The random sample must be selected BEFORE grading the assignment: evaluation for ABET is based on the rubrics and is separate from grading. Make sure that the population is random.
- $\bullet\,$ If an artifact is blank, you can throw it out but replace with another random sample.
- $\bullet\,$ Keep documentation of the assessment and prepare summary of the results:
 - Description of the assignment
 - Selected samples and their evaluation with rubrics
 - A report: results, how many students attained exceed expectations and meet expectations levels, discuss the results.
